The Model Existence Theorem

Key Concepts

- Extend T to a Henkin theory T_H , then complete it to a theory $T^\prime.$
- T' is a complete Henkin theory for the extended language \mathcal{L}_H .
- For T', its term model $\mathcal{A}_{T'}$ satisfies

$$\mathcal{A}_{T'} \models \sigma \iff T' \vdash_{\mathcal{L}_{H}} \sigma$$

for all $\mathcal{L}_{H}\text{-sentences }\sigma.$

Problems

Exercise 0.1.

How do we obtain a model for T from a model for T'?

Exercise 0.2.

Why is $\mathcal{A}_{T'}$ countable if \mathcal{L} is countable?

Exercise 0.3.

Let X be the set of all maximally consistent \mathcal{L} -theories. Recall that the sets

$$\langle \sigma \rangle = \{ T \in X \colon \sigma \in T \} \quad (\sigma \ \mathcal{L}\text{-sentence})$$

generate a Hausdorff topology on X.

Show that the topology is compact.
